

ERP-Gathering Kielce

Number of the workshop: 26

How can digital and new technologies make communities thrive?

Our responses to challenges:

1. Specific digital technologies need to be adapted - in specific places.
2. Digital technology should not be the enemy.
3. Sustainable of Digital technologies
4. Ecological intelligence
5. Changing the mindset communication
6. Affordability of tech
7. Lack of digital skills centres

Our three proposals for governments & EU

1. Find funding for the Countries and the European Union to organize new projects to support new digital tools and opportunities for building local communities.
2. To provide wider learning methods and opportunities in rural areas about and around digital tools. The current offer does not even cover the majority of consumers.
3. Promote digital training in educational institutions from an early age, adapting programs according to the development phase and regional needs.

Good ideas, practices, processes

Starting all the above-mentioned processes with smart villages is a great opportunity for growth and development. Opportunities to learn and to learn more skills related to smart devices and their technology. More opportunities for us to make people better. To give people the opportunity to learn technology courses, especially for older people. Engage people to use smart devices more and apply it to the stage of life. Wider availability of internet connection in every town.
